U.S. License No. 347

Abbott
NAME AND INTENDED USE
The ABBOTT PRISM HIV O Plus assay is an in vitro chemiluminescent immunoassay (ChLIA) for the qualitative detection of antibodies to HIV-1 (anti-HIV-1) Groups M and O and/or antibodies to HIV-2 (anti-HIV-2) in human serum and plasma specimens. The ABBOTT PRISM HIV O Plus assay is intended to screen individual human donors, including volunteer donors of Whole Blood and blood components and other living donors, for the presence of anti-HIV-1 Groups M and O and/or anti-HIV-2. The assay is also intended for use in testing blood and plasma specimens to screen organ donors when specimens are obtained from heart donors in which the donor’s heart is still beating, in testing blood specimens to screen cadaveric (non–heart-beating) donors, and as an aid in the diagnosis of HIV-1/HIV-2 infection. It is not intended for use in testing cord blood specimens.

SUMMARY AND EXPLANATION OF THE TEST
The ABBOTT PRISM HIV O Plus assay uses recombinant DNA-derived antigens corresponding to three viral proteins (HIV-1 Group M envelope, HIV-1 Group O envelope, and HIV-2 envelope) and one synthetic peptide corresponding to HIV-2 envelope.

Epidemiological data suggest that the acquired immunodeficiency syndrome (AIDS) is caused by at least two types of human immunodeficiency viruses, collectively designated HIV. Human immunodeficiency virus type 1 (HIV-1), the first-discovered AIDS virus, has been isolated from patients with AIDS and from healthy persons at high risk for AIDS.1,2 HIV-1 is transmitted by sexual contact, by exposure to blood or blood products, or by an infected mother to her fetus or child.3 HIV-2 was isolated from patients with AIDS in West Africa.4 The HIV-2 virus is similar to the HIV-1 virus in its morphology, cell tropism, interaction with the CD4 cellular receptor, and in vitro cytopathic effect on CD4 cells, overall genomic structure, transmission route, and its ability to cause AIDS.5-8 HIV-1 has not spread substantially outside of West Africa; the prevalence of HIV-2 in North and South America and Europe is low.9 HIV-2 prevalence is stable or declining in West African countries.8 HIV-1 isolates have been classified into three groups: Group M (main), Group O (outlier), and Group N (non-M/non-O). Group M has 9 subtypes (A, B, C, D, F, G, H, J, K) and many circulating recombinant forms (CRFs).9,10 Group M has been identified worldwide; however, the geographic distribution and regional predominance of Group M subtypes vary with epidemiological spread. All HIV-1 Group M subtypes have been found in Africa.11-13 The predominant strain in North America, South America, Europe, and Australia is subtype B, although other subtypes are also present in these regions.11,13 The predominant strains in Southeast Asia are CRF01_AE (formerly subtype E) and subtype B, while the predominant strains in India are subtype C.11,13 Group O is found primarily in Cameroon and west central Africa, but also has been identified in the US and Europe.14-19 HIV-1 Group O was identified as a strain highly divergent from the Group M strains.20-22 The genetic diversity within Group O strains is similar to the level of diversity among Group M strains; however, Group O strains have not been classified into subtypes.22 Group N has been identified only in Cameroon and is rare.23-25 The global distribution and predominance of HIV-1 strains are affected by epidemiological factors and will continue to change over time.11,13

BIOLOGICAL PRINCIPLES OF THE PROCEDURE
The ABBOTT PRISM HIV O Plus assay is a three-step sandwich ChLIA. The reactions occur within the ABBOTT PRISM System in the following sequence:

- Microparticles coated with HIV antigens (recombinant proteins) are incubated with sample (either plasma, serum, calibrator, or control) in the incubation well of the reaction tray. During incubation, HIV-1 and/or HIV-2 antibodies present in the sample bind to the antigen(s) on the microparticles.
- After this first incubation is complete, the reaction mixture is transferred to the glass fiber matrix (matrix) of the reaction tray using the transfer waste wash. The microparticles are captured by the matrix, while the remaining mixture flows through to an absorbent blotter.
- A probe mixture (probe) consisting of biotinylated HIV-1 recombinant proteins and biotinylated HIV-2 peptide is added to the microparticles on the matrix and incubated. The probe binds to the microparticle-antibody complex created during the first incubation process. After the second incubation, the unbound probe is washed into the blotter with the conjugate wash.
- The acridinium-labeled anti-biotin conjugate is added to the microparticles on the matrix and incubated to bind any probe that is present. After the third incubation, the bound conjugate is washed into the blotter with the conjugate wash.
- The chemiluminescent signal is generated by addition of an alkaline hydrogen peroxide solution. The resultant photons are counted.

The amount of light emitted is proportional to the amount of anti-HIV-1 and/or anti-HIV-2 in the sample. The presence or absence of anti-HIV-1/HIV-2 in the sample is determined by comparing the number of photons collected from the sample to a cutoff value determined from a calibration performed in the same batch. If the number of photons collected from a test sample is less than the cutoff value, the sample is considered nonreactive for anti-HIV-1 and anti-HIV-2 by the criteria of the ABBOTT PRISM HIV O Plus assay. These specimens need not be further tested. If the number of photons collected from a test sample is greater than or equal to the cutoff value, the sample is considered reactive for anti-HIV-1 and/or anti-HIV-2 by the criteria of the ABBOTT PRISM HIV O Plus assay. Specimens that are initially reactive must be handled as described in the Preparation for Analysis section of this package insert and retested in duplicate. Reactivity in either or both of these duplicate tests (i.e., repeatedly reactive) is highly predictive of the presence of HIV-1 and/or HIV-2 antibodies in individuals at risk for HIV infection. Follow appropriate FDA recommendations and regulations for specimens found to be repeatedly reactive. Customers outside the US must follow their country’s government recommendations and regulations for specimens found to be repeatedly reactive. For further information regarding ChLIA technology, refer to the ABBOTT PRISM Operations Manual, Section 3.

Repeatedly reactive specimens obtained from people at risk for HIV infection are usually found to contain antibodies by supplemental tests included in the FDA or other country’s recommendations. Certain specimens may require nucleic acid amplification testing or culture to ensure confirmation. A full differential diagnostic workup for the diagnosis of AIDS and AIDS-related conditions necessarily includes an examination of the patient’s immune status and clinical history.

REAGENTS
NOTE: Each specific component description that follows is accompanied by a unique symbol. These symbols appear on both the component labels and on corresponding instrument tubing identifier labels. They are meant to facilitate identification and installation of reagent bottles within the ABBOTT PRISM System ambient reagent bay and refrigerator.

ABBOTT PRISM HIV O Plus Assay Kit [REF 3L68-68]

NOTE: Do not mix reagents from different bottles. Do not mix or interchange reagents from different ABBOTT PRISM HIV O Plus Assay Kits.

- **MICROPARTICLES**
  - 1 Bottle (324 mL) HIV-1/HIV-2 (E. coli, B. megaterium, recombinant) antigen coated microparticles in phosphate buffer with CHAPS. Minimum activity with PC: 3.00 S/CO. Minimum activity with PC: 2.00 S/CO. Minimum activity with OPC: 1.50 S/CO. Preservative: 0.1% sodium azide. (Symbol: ！)

- **CONJUGATE**
  - 1 Bottle (331 mL) Anti-biotin (mouse monoclonal): acridinium conjugate in phosphate buffered saline with Triton X-100 and protein stabilizers. Minimum concentration: 0.050 μg/mL. Preservative: 0.1% sodium azide. (Symbol: ▲)

- **CALIBRATION**
  - 3 Bottles (10.4 mL each) Negative Calibrator. Recalculated human plasma. Preservative: 0.1% sodium azide. (Symbol: NC)

- **CALIBRATION**
  - 3 Bottles (10.4 mL each) Positive Calibrator. Recalculated, inactivated, human plasma reactive for anti-HIV-1. Minimum activity: 3.00 S/CO. Preservative: 0.1% sodium azide. (Symbol: PC)

- **CALIBRATION**
  - 3 Bottles (10.4 mL each) HIV-2 Positive Assay Control (1). Recalculated, inactivated, human plasma reactive for anti-HIV-2. Minimum activity: 2.00 S/CO. Preservative: 0.1% sodium azide. (Symbol: OPC)

NOTE: The ABBOTT PRISM HIV O Plus Calibration Report identifies the ABBOTT PRISM HIV O Plus Calibration Control (PC2) as “Pos Assay CTL (1).”

- **CALIBRATION**
  - 3 Bottles (10.4 mL each) HIV-1 Group O Positive Assay Control (2) containing HIV-1 Group O (mouse monoclonal) antibody in recalculated human plasma. Minimum activity: 1.50 S/CO. Preservative: 0.1% sodium azide. (Symbol: OPC)

NOTE: The ABBOTT HIV PRISM HIV O Plus Calibration Report identifies the ABBOTT PRISM HIV O Plus HIV-1 Group O Positive Assay Control (OPC) as “Pos Assay CTL (2).”

- **PROBE**
  - 1 Bottle (16 mL) Probe 20x Concentrate containing biotinylated HIV-1/HIV-2 (E. coli, recombinant) antigen and synthetic peptide in borate buffer with protein stabilizers. Minimum concentration: 6.54 μg/mL. Preservative: 0.1% sodium azide. (No Symbol)

NOTE: Probe 20x Concentrate MUST be mixed with Probe Diluent prior to use.
**Product Diluent**
- 4 Bottles (900 mL each) Activator Diluent. 0.3 N 3L68-58 (or 3L27-01)
- 1 Bottle (3364 mL) Transfer Wash. Borate buffered (Symbol: 0.1% sodium azide. (Symbol: ℮)

**Other Reagents Required**

**ABBOTT PRISM HIV O Plus Wash Kit** (REF 3E60-10)
- **Transfer Wash**
  - 1 Bottle (3364 mL) Transfer Wash. Borate buffered saline. Preservative: 0.1% sodium azide. (Symbol: ℮)
- **Conjugate Wash**
  - 1 Bottle (2794 mL) Conjugate Wash. TRIS buffer. Preservative: 0.1% sodium azide. (Symbol: ℮)
- **Probe Wash**
  - 1 Bottle (2258 mL) Probe Wash. TRIS buffer. Preservative: 0.1% sodium azide. (Symbol: ℮)

**ABBOTT PRISM Activator Concentrate** (REF 1A75-02 or 3L27-02)
- **Activator Concentrate**
  - 4 Bottles (900 mL each) Activator Concentrate. 3.4% hydrogen peroxide/0.06% diethyleneetriaminepentaacetic acid.

**ABBOTT PRISM Activator Diluent** (REF 1A75-01 or 3L27-01)
- **Activator Diluent**
  - 4 Bottles (900 mL each) Activator Diluent. 0.3 N sodium hydroxide.

**ABBOTT PRISM Run Control Kit** (REF 3E60-10)

Or **ABBOTT PRISM Positive Run Control Kit** (REF 3E60-11)

**Safety Precautions**

**CAUTION**: This product contains human-sourced and/or potentially infectious components. Refer to the REAGENTS section of this package insert. No known test method can offer complete assurance that products derived from human sources or inactivated microorganisms will not transmit infection. Therefore, all human-sourced materials should be considered potentially infectious. It is recommended that these reagents and human specimens be handled in accordance with the OSHA Standard on Bloodborne Pathogens[26]. Biosafety Level 2[27] or other appropriate biosafety practices[28,29] should be used for materials that contain or are suspected of containing infectious agents. These precautions include, but are not limited to, the following:

- Wear gloves when handling specimens or reagents.
- Do not pipette by mouth.
- Do not eat, drink, smoke, apply cosmetics, or handle contact lenses in areas where specimens or reagents are handled.
- Clean and disinfect all spills of specimens or reagents using an appropriate disinfectant such as 0.1% sodium hypochlorite, or other suitable disinfectant.[30,31]
- Decontaminate and dispose of all specimens, reagents, and other potentially contaminated materials in accordance with local, state, and federal regulations.[32,33]
- The human plasma used in the negative calibrator is nonreactive for HBsAg, HIV-1 RNA or HIV-1 Ag, anti-HIV-1/HIV-2, and anti-HCV.
- The human plasma used in the positive calibrator is reactive for anti-HIV-1 and anti-HCV.
- The human plasma used in the HIV-2 Positive Assay Control (1) is reactive for anti-HIV-2 and nonreactive for HBsAg, HIV-1 RNA or HIV-1 Ag and anti-HCV.
- The human plasma used in the HIV-1 Group O Positive Assay Control (2) contains HIV-1 Group O (mouse monoclonal) antibody in recalcified human plasma. Plasma is nonreactive for HBsAg, HIV-1 RNA or HIV-1 Ag, anti-HIV-1/HIV-2, and anti-HCV.

**The following warnings and precautions apply to the Purge Concentrate**

**WARNING:** Contains methylisothiazolones.
- **Prevention**
  - P261 Avoid breathing mist / vapours / spray.
  - P272 Contaminated work clothing should not be allowed out of the workplace.
  - P280 Wear protective gloves / protective clothing / eye protection.
- **Response**
  - P332+P33+P313 If skin irritation or rash occurs: Get medical advice / attention.
  - P364 Take off contaminated clothing and wash it before reuse.
- **Disposal**
  - P501 Dispose of contents/container in accordance with local regulations.

**This product contains sodium azide; for a specific listing, refer to the REAGENTS section of this package insert. Contact with acids liberates very toxic gas. This material and its container must be disposed of in a safe way.**

**Safety Data Sheets** are available at www.abbottdiagnostics.com or contact your local representative.

**Handling Precautions**

- Do not use kits beyond the expiration date.
- Gently invert each component several times prior to loading the original container on the ABBOTT PRISM System to ensure a homogeneous solution. Additional gentle inversion may be required to thoroughly resuspend microparticles. Avoid foaming.
- Gently invert calibrators and assay controls in the calibrator pack several times prior to each use.
- Each component of the ABBOTT PRISM HIV O Plus Wash Kit should be at room temperature (15-30°C) and then mixed before loading onto the ABBOTT PRISM System.
- Do not mix reagents or calibrators/assay controls from different lots. Do not mix or interchange reagents from different ABBOTT PRISM HIV O Plus Assay Kits.
- Any lot of ABBOTT PRISM HIV O Plus Wash Kit can be used with any lot of ABBOTT PRISM HIV O Plus Assay Kit.
- Any lot of ABBOTT PRISM Activator Concentrate, ABBOTT PRISM Activator Diluent, and Control from an ABBOTT PRISM Run Control Kit or ABBOTT PRISM Positive Run Control Kit may be used with any lot of ABBOTT PRISM Assay Kit.
- Any lot of ABBOTT PRISM HIV O Plus Wash Kit can be used with any lot of ABBOTT PRISM HIV O Plus Assay Kit.
- Treat negative and positive calibrators and controls as potentially infectious.
- Avoid microbial and chemical contamination of samples, reagents, and equipment. The use of disposable pipette tips is recommended for any preliminary sample transfer.
- Use accurately calibrated equipment.
- Do not freeze reagents.
• Failure to adhere to instructions in the ABBOTT PRISM Operations Manual or this package insert may result in erroneous test results.
• Use caution when handling samples, reagent bottles, and reagent caps to prevent cross contamination.

Additional safety and handling precautions and limitations for the assay kit, calibrators, specimens, controls, and other reagents are described in the ABBOTT PRISM Operations Manual, Sections 7 and 8.

Preparation of the Diluted Probe
NOTE: Preparation of probe solution does not require the diluent or concentrate to equilibrate to room temperature prior to combining and mixing.
1. Carefully empty the entire contents of the small probe 20x concentrate dropper bottle into the larger probe diluent bottle by slowly squeezing the dropper tip inside four to ten times while keeping the dropper tip within the opening of the probe diluent bottle. Avoid foaming. Solution will turn light red in color.
2. Write the date of preparation, the date of expiration, the lot number of probe 20x concentrate (REF 3L68H), and the preparer’s name on the probe diluent label on the large bottle, in the spaces provided.

NOTE: The diluted probe must be used within 56 days of preparation.
3. Reseal the large bottle and mix thoroughly by slowly inverting several times. Do not vortex.
4. Place in the ABBOTT PRISM System refrigerator. Refer to the ABBOTT PRISM Operations Manual, Section 5, PREPARE AND LOAD REAGENTS, for additional information.

Preparation of Activator Solution
Activator solution must be prepared by mixing equal parts of ABBOTT PRISM Activator Concentrate and ABBOTT PRISM Activator Diluent. The activator solution expires 24 hours from preparation. The ABBOTT PRISM Activator Concentrate may be used immediately after removing from the refrigerator. The volume of activator solution required for multiple tests is calculated by the ABBOTT PRISM System software. Refer to the ABBOTT PRISM Operations Manual Glossary for the definition of purified water. Prepare the activator solution in the bottle provided in the ABBOTT PRISM Accessory Kit (REF GA36-60). Cover the bottle opening securely with the cap provided and invert gently five to ten times to mix. Load the activator solution on the ABBOTT PRISM System. Refer to the ABBOTT PRISM Operations Manual, Section 5, PREPARE AND LOAD ACTIVATOR SOLUTION, for additional information.

NOTE: The activator solution must be used within 24 hours of preparation.

Storage Instructions
- Store the ABBOTT PRISM HIV O Plus Assay Kit, ABBOTT PRISM Run Control Kit, ABBOTT PRISM Positive Run Control Kit, and ABBOTT PRISM Activator Concentrate at 2-8°C.
- The diluted probe must be stored at 2-8°C and used within 56 days of preparation.
- Store the ABBOTT PRISM HIV O Plus Wash Kit and ABBOTT PRISM Activator Diluent at room temperature (15-30°C).
- The activator solution must be stored at 15-30°C and used within 24 hours of preparation.
- When stored and handled as directed, reagent and wash kit components are stable until the expiration date.
- Store ABBOTT PRISM Pipette Tips and ABBOTT PRISM Reaction Trays in their original packaging until use.

Indications of Instability or Deterioration of Reagents
The ABBOTT PRISM System will not continue to process samples when calibrator or positive assay control values do not meet specifications. This may indicate either deterioration or contamination of reagents, or instrument failure. Refer to the ABBOTT PRISM Operations Manual, Section 10, for additional information.

INSTRUMENT PROCEDURE
• For the software versions that may be used to perform the assay, refer to the ABBOTT PRISM Assay / Software Version Matrix located in the Supplemental Information tab of the ABBOTT PRISM Operations Manual.
• Refer to the ABBOTT PRISM Operations Manual for a detailed description of instrument procedures.
• Refer to the ABBOTT PRISM Operations Manual, Section 7, for limitations associated with test management.
• Solutions required for instrument cleaning and maintenance are described in detail in the ABBOTT PRISM Operations Manual, Sections 5 and 9.
• For optimal performance, it is important to follow the routine maintenance procedures defined in the ABBOTT PRISM Operations Manual, Section 9.

SPECIMEN COLLECTION AND PREPARATION FOR ANALYSIS

Specimen Types
• For living donors, serum (including serum collected in serum separator tubes), plasma collected in EDTA, potassium oxalate, sodium citrate, ACD-A, ACD-B, CP2D, CPD, or CPDA-1 anticoagulants, or plasma collected from segmented tubing may be used with the ABBOTT PRISM HIV O Plus assay. Follow the manufacturer’s specimen collection instructions for serum and plasma collection tubes.
• For cadaveric donors, only serum may be used; follow general standards and/or regulations for collection.
• Do not use cadaveric plasma specimens.

Specimen Conditions
• This assay was designed and validated for use with individual human serum and plasma specimens. This assay has not been validated for use with pooled specimens.
• For living donors and cadaveric (non-heart-beating) donors, serum from heparinized patients may be incompletely coagulated resulting in potential instrument errors such as drain time errors due to the presence of fibrin. To prevent this phenomenon, draw specimen prior to heparin therapy or after heparin therapy is discontinued and activated partial thromboplastin time (aPTT) levels return within normal range.
• Do not use heat-inactivated specimens.
• Do not use specimens with obvious microbial contamination.
• Performance has not been established using umbilical cord blood or body fluids such as urine, saliva, semen, amniotic fluid, cerebrospinal fluid, or pleural fluid. These specimens should not be tested using the ABBOTT PRISM HIV O Plus assay.
• Clear, nonhemolyzed specimens should be used when possible. Specimens containing visible particulate matter may give erroneous or inconsistent test results.
• No qualitative performance differences were observed when a minimum of 24 nonreactive and 72 low-level reactive specimens were spiked with elevated levels of bilirubin (≤ 20 mg/dL), hemoglobin (≤ 500 mg/dL), red blood cells (≤ 0.4% v/v), triglycerides (≤ 3000 mg/dL), or protein (≤ 12 g/dL). However, specimens that contain greater concentrations of these potentially interfering substances have not been tested. The impact of greater concentrations of these potentially interfering substances on the ABBOTT PRISM HIV O Plus assay is unknown.
Preparation for Analysis

Failure to follow the specified centrifugation procedure may give erroneous or inconsistent test results.

For Abbott PRISM HIV O Plus, inadequate centrifugation of nonfrozen plasma specimens can lead to elevated reactive rates due to platelet interference.

Nonfrozen plasmapheresis specimens do not require centrifugation. All other specimens (including previously frozen plasmapheresis specimens) must be centrifuged as described in this section.

Nonfrozen serum specimens must be centrifuged such that g-minutes are between 30,000 and 75,000. A refrigerated or nonrefrigerated centrifuge is acceptable for use. The acceptable time and force ranges that meet this criterion are listed in Table I.

Any specimen that is not tested or retested within 24 hours of initial centrifugation must be recentrifuged as described in Table I.

Note: Filtered cadaveric specimens that are not tested within 24 hours of initial centrifugation must be recentrifuged, but do not need to be refiltered.

Table I: Nonfrozen Serum Specimens

</tbody>
</table>

Nonfrozen plasma specimens must be centrifuged such that g-minutes are between 45,000 and 75,000. A refrigerated or nonrefrigerated centrifuge is acceptable for use. The acceptable time and force ranges that meet this criterion are listed in Table II.

Any specimen that is not tested or retested within 24 hours of initial centrifugation must be recentrifuged as described in Table II.

Previously frozen specimens must be mixed gently and thoroughly after thawing and centrifuged such that g-minutes are between 180,000 and 300,000. A refrigerated or nonrefrigerated centrifuge is acceptable for use. The acceptable time and force ranges that meet this criterion are listed in Table III.

Any previously frozen specimen that is not tested or retested within 24 hours of initial centrifugation and not refrozen must be recentrifuged at 30,000 to 75,000 g-minutes.

Additional Centrifugation Information

Convert rpm to RCF as follows: \( RCF = 1.12 \times \frac{t_{max}}{rpm} \) \( \times 1000 \)

Convert RCF to rpm as follows: \( rpm = \frac{1000 \times RCF}{1.12 \times t_{max}} \)

Centrifugation Time - The time should be measured from the time the rotor reaches the required RCF or rpm to the time it begins decelerating.

\( t_{max} \) - Radius of the rotor in millimeters. The radius measured is dependent on whether the rotor is a fixed angle rotor or a swinging bucket rotor. This value is typically provided with the rotor by the manufacturer. For the fixed angle rotor, \( t_{max} \) is the measure of the distance from the rotor axis (center) to the bottom of the specimen tube in the rotor or rotor adapter. For the swinging bucket rotor, \( t_{max} \) is the measure of the distance from the rotor axis (center) to the bottom of the specimen tube in the rotor adapter or bucket at full extension.

Note: If custom tube adapters (i.e., adapters not defined by the centrifuge manufacturer) are used, then the radius \( t_{max} \) should be manually measured in millimeters and the RCF calculated.

G - The unit of measure for the product of RCF (x g) and centrifugation time (minutes).

Filteration of Centrifuged Cadaveric Serum Specimens

Failure to adhere to the following instructions may result in erroneous or inconsistent test results.

Wear personal protective equipment, including eyewear.

After centrifugation, filter each cadaveric specimen through a Millipore GV Filter as follows:

1. Label an empty tube with the specimen identification number matching the original tube.
2. Remove the plunger from a 10 cc syringe.

   Note: Do not use a syringe smaller than 10 cc because excess pressure may build up, potentially causing damage to the filter unit or personal injury.
3. Remove the sterile filter from the package.
4. Securely screw the syringe to the filter.
5. Do not touch the tip of the filter to avoid possible contamination.
6. Pour a minimum of 1 mL of the centrifuged cadaveric serum into the syringe.

   Note: Additional volume may be required based on the number of Abbott PRISM assays performed. Refer to the Specimen Volume section of this package insert.
7. While holding the filter syringe unit over the tube, insert the plunger and slowly apply pressure to deliver the filtered cadaveric serum.

   Note: A clogged filter will resist pressure and no additional sample volume will pass through.

If necessary, replace the clogged filter as follows:

a. Remove the sterile filter from the package.

b. Carefully invert the syringe to a filter-side-up position with the syringe plunger intact to prevent sample leakage. Gently remove the clogged filter and dispose of it in a potentially infectious waste container.

c. Securely screw the syringe to the filter.

d. Slowly apply pressure on the plunger to deliver the filtered cadaveric serum into the tube.

e. Repeat this step as needed to successfully complete the filtration process.

Note: Filtered cadaveric specimens that are not tested within 24 hours of initial centrifugation must be recentrifuged, but do not need to be refiltered.
Abbott Prism HIV O Plus Assay Procedure

Key procedures that require operator interaction for testing samples are listed below. For detailed information concerning batch time, maximum batch size, reagent handling and loading and associated procedural steps, refer to the Abbott Prism Operations Manual, Sections 2, 5, and 7.

1. Enter a Plan Work Load (refer to the Abbott Prism Operations Manual, Section 5).
2. Replace reagents as needed (refer to the Abbott Prism Operations Manual, Sections 5 and 7). Prepare diluted probe, if necessary. Refer to the Preparation of the Diluted Probe section of this package insert.
3. All testing is performed on the Abbott Prism System. NOTE: Gently invert each component several times prior to loading on the Abbott Prism System to ensure a homogeneous solution. Additional gentle inversion may be required to thoroughly resuspend microparticles. Avoid foaming. Gently invert calibrators and assay controls in the calibrator pack several times prior to each use. Each component of the Abbott Prism HIV O Plus Wash Kit should be at room temperature (15-30°C) and then mixed before loading onto the Abbott Prism System.
4. Verify that all tubing label symbols match the symbols on each reagent label. (Refer to the symbol key in the REAGENTS section of this package insert and the ambient reagent bay and refrigerator diagrams provided with the Abbott Prism System).
5. Verify that all tubing is securely fastened to the corresponding wash and reagent bottles.
6. Inspect the waste containers. Empty and clean as defined in the Abbott Prism Operations Manual, Section 8, if necessary.
7. Prepare activator solution (refer to the Preparation of Activator Solution section of this package insert) and load onto the Abbott Prism System.
8. Verify that an adequate number of Abbott Prism Reaction Trays are in the Tray Loader.
9. Verify that an adequate number of Abbott Prism Pipette Tips are in the Pipette Tip Racks.
11. Initiate sample processing. Gently invert calibrators and assay controls in the calibrator pack several times. Open the bottles in the calibrator pack and place in the calibrator rack. Load the calibrator rack and sample racks, including the run controls. (Refer to the QUALITY CONTROL PROCEDURES, Controls, Control Handling Procedure, in this package insert.)
12. After the calibrators and positive assay controls have been automatically pipetted, remove the calibrator rack. Close the calibrator and positive assay control bottles and return them to 2-8°C storage.
13. Each specimen is initially tested once, unless the operator overrides this automatic function of the Abbott Prism System.
14. Sample racks may be removed after the samples have been pipetted.

NOTE: No operator interaction is required for the following steps, which are automatically carried out by the Abbott Prism System: reaction tray transport, calibrator/assay control/sample/release control pipetting, incubation, reagent dispense, sample reading, data reduction, run validity and result determination.

15. After specimen processing is complete, perform the purge procedure. (Refer to the Abbott Prism Operations Manual, Section 5). Refer to the Abbott Prism Operations Manual, Section 3, for a detailed description of ChLIA procedures. The Abbott Prism HIV O Plus assay is a three-step ChLIA procedure.

Materials Provided

- Abbott Prism HIV O Plus Assay Kit

Materials Required but not Provided

- Abbott Prism HIV O Plus Wash Kit
- Abbott Prism Activator Concentrate
- Abbott Prism Activator Diluent
- Abbott Prism Reaction Trays
- Abbott Prism Pipette Tips
- Abbott Prism Accessory Kit
- Abbott Prism Run Control Kit
- Abbott Prism Positive Run Control Kit
- Abbott Prism Run Control Adapters
- Protective Disposable Gloves
- Disinfectant
- Purified Water-rinsed or Clean Disposable Measuring Equipment

For Cadaveric Specimens Only

- Millipore GV Filters
- 10 cc Sterile Syringes

Additional Materials Available

- Abbott Prism Sample Cups
- Abbott Prism Activator Line Treatment
- Abbott Prism Prime/Purge Accessories
- Abbott Prism Line Cleaner

Specimen Volume

The specimen volume required to test a single sample on the Abbott Prism System varies according to the number of assays configured, which assays are selected, and the type (size) of specimen container used. The Abbott Prism HIV O Plus assay requires a 100 µL sample dispense. For Abbott Prism Sample Cups, the minimum specimen volume required for one Abbott Prism HIV O Plus assay is 400 µL. For either primary or aliquot tubes, or additional assay volume requirements, refer to the Abbott Prism Operations Manual, Section 5.

PROCEDURE
QUALITY CONTROL PROCEDURES

Interpretation of Results

• In the ABBOTT PRISM HIV O Plus assay, specimens with net counts less than the cutoff value are nonreactive and need not be tested further. Nonreactive specimens are considered negative for anti-HIV-1 and anti-HIV-2 by the criteria of the ABBOTT PRISM HIV O Plus assay.

• Specimens with net counts greater than or equal to the cutoff value are considered initially reactive by the criteria of the ABBOTT PRISM HIV O Plus assay. All initial reactive specimens restested within 24 hours of initial centrifugation do not require retesting. All initial reactive specimens (excluding nonfrozen plasmapheresis stored greater than 24 hours after initial centrifugation) must be restested prior to restesting according to the Preparation for Analysis section of this package insert. Initially reactive specimens must be restested in duplicate using the ABBOTT PRISM HIV O Plus Assay Kit.

• If the sample net counts for both restests are less than the cutoff value, the specimen is nonreactive. Nonreactive specimens are considered negative for anti-HIV-1 and anti-HIV-2 by the criteria of the ABBOTT PRISM HIV O Plus assay.

• If the sample net counts for either duplicate restest are greater than or equal to the cutoff value, the specimen is considered repeatedly reactive. Repeatedly reactive results indicate the presence of anti-HIV-1 and/or anti-HIV-2 by the criteria of the ABBOTT PRISM HIV O Plus assay.

• Follow appropriate FDA recommendations and regulations for specimens found to be repeatedly reactive. Customers outside the US must follow their country’s government recommendations and regulations for specimens found to be repeatedly reactive.

• Because of possible nonspecific reactions due to causes other than HIV infection, particularly when testing low prevalence populations (e.g., blood donors), it is appropriate to further investigate specimens found to be repeatedly reactive by the ABBOTT PRISM HIV O Plus assay to prove that HIV antibodies are indeed present. Repeatedly reactive specimens obtained from people at increased risk for HIV infection are usually found to contain antibodies by supplemental tests, e.g., Western blot, IFA, or RIPA.

• Although the association of infectivity of donated blood or plasma and the presence of anti-HIV-1/HIV-2 is strong, it is recognized that presently available methods for anti-HIV-1/HIV-2 detection are not sensitive enough to detect all potentially infectious units of blood, plasma, or possible cases of HIV-1/HIV-2 infection. A nonreactive test result does not exclude infection.

Reading Results

Some S/CO values may be flagged with “<” or “>” symbols. For more information on sample reports, refer to the ABBOTT PRISM Operations Manual, Section 5: Operating Instructions, Reports. The ABBOTT PRISM System reports sample results in net counts and S/CO. Net Counts are used by the ABBOTT PRISM System to interpret results. The S/CO value is provided in reports to show reactivity relative to the cutoff value. In the ABBOTT PRISM HIV O Plus assay, S/CO values greater than 1.00 are reported as reactive. Specimens with an S/CO value of greater than or equal to 1.00 are reported as reactive.

System Errors

For a description of the error codes that appear on ABBOTT PRISM System reports, refer to the ABBOTT PRISM Operations Manual, Section 10.

LIMITATIONS OF THE PROCEDURE

• This assay was designed and validated for use with individual human serum and plasma specimens. This assay has not been validated for use with pooled specimens.

• Do not use specimens collected in heparin. Use of heparin as an anticoagulant may cause a reduction in sample net counts and in S/CO for ABBOTT PRISM HCV; therefore, heparin is not recommended for any ABBOTT PRISM assay.

• For living donors and cadaveric (non-heart-beating) donors, serum from heparinized patients may be incompletely coagulated resulting in potential instrument errors such as drain time errors due to the presence of fibrin. To prevent this phenomenon, draw specimen prior to heparin therapy or after heparin therapy is discontinued and activated partial thromboplastin time (aPTT) levels return within normal range.

• False-reactive test results can be expected with any test kit. False-reactive test results have been observed due to nonspecific interactions. Refer to the SPECIFIC PERFORMANCE CHARACTERISTICS section of this package insert for assay performance characteristics.
Some specimens that have undergone multiple freeze/thaw cycles or have been stored frozen for prolonged periods may result in erroneous or inconsistent test results.

An increased occurrence of drain time errors may be observed for cadaveric specimens.

Do not use cadaveric plasma specimens.

All specimens, except nonfrozen plasma specimens, must be centrifuged according to the Preparation For Analysis section of this package insert prior to running the assay.

Inadequate centrifugation of nonfrozen plasma specimens can lead to elevated reactive rates due to platelet interference.

Performance has not been established using umbilical cord blood or body fluids such as urine, saliva, semen, amniotic fluid, cerebrospinal fluid, or pleural fluid. These specimens should not be tested using the ABBOTT PRISM HIV O Plus assay.

Do not use heat-inactivated specimens.

Do not use specimens with obvious microbial contamination or gross lipemia.

Do not use specimens with obvious gross hemolysis (dark red to black).

No qualitative performance differences were observed when living donor specimens were spiked with 500 mg/dL of hemoglobin.

No qualitative performance differences were observed for living donor specimens with up to 1,690 mg/dL, endogenous levels of hemoglobin.

No qualitative performance differences were observed for cadaveric donor specimens with up to 631 mg/dL of hemoglobin.

Avoid microbial contamination of reagents or wash kit components by carefully following handling precautions within this package insert.

The ABBOTT PRISM HIV O Plus assay does not discriminate between HIV-1 and HIV-2 antibody reactivity.

A test result that is negative does not exclude the possibility of exposure to or infection with HIV-1 and/or HIV-2. Negative results in this assay in individuals with prior exposure to HIV-1 and/or HIV-2 may be due to antibody levels below the limit of detection of this assay or lack of antibody reactivity to the HIV antigens used in this assay.

The presence of HIV-1 and/or HIV-2 antibodies is not a diagnosis of AIDS. Follow appropriate FDA recommendations for specimens found to be repeatedly reactive. Individuals who are repeatedly reactive should be referred for medical evaluation, which may include additional testing.

A person who has antibodies to HIV-1 is presumed to be infected with the virus, except a person who has participated in an HIV vaccine study and may or may not be infected with HIV. Clinical correlation is indicated with appropriate counseling, medical evaluation, and possibly additional testing to decide whether a diagnosis of HIV infection is accurate.

SPECIFIC PERFORMANCE CHARACTERISTICS

Assay Reproducibility

Assay reproducibility was determined by testing a 6-member panel consisting of 1 specimen nonreactive for anti-HIV-1/HIV-2 (panel member 1), 2 diluted specimens reactive for anti-HIV-1 (panel members 2 and 3), 2 diluted specimens reactive for anti-HIV-2 (panel members 4 and 5), and 1 diluted specimen reactive for anti-HIV-1 Group O (panel member 6). Panel members were prepared in recalcified human plasma. Each panel member was tested in replicates of 4 in 5 runs over 5 days with each of 3 reagent lots at 5 sites. The Negative, Positive, and Supplemental Positive Controls were tested once at the beginning and end of each run on each subchannel. The Negative and Positive Calibrators, HIV-2 Positive Assay Control (1), and HIV-1 Group O Positive Assay Control (2) were tested in triplicate at the beginning of each run on each subchannel. The intra-assay and inter-assay standard deviation (SD) and percent coefficient of variation (%CV) were determined with a variance component analysis for a random effects model (Table IV).

Assay Specificity

A total of 6,284 fresh serum specimens and 6,181 fresh plasma specimens from volunteer blood donors were collected and tested at 4 geographically distinct blood centers (Table V). A total of 3,134 specimens from plasmapheresis donors were collected and tested at a fifth geographically distinct blood center (Table V). The initial and repeat reactive rates for the serum specimens were 0.06% (4/6,284) and 0.03% (2/6,284), respectively. Both the initial and repeat reactive rates for the plasma specimens were 0.08% (5/6,181). Both the initial and repeat reactive rates for the plasmapheresis donor specimens were 0.10% (3/3,134). Repeatedly reactive specimens were further tested using an FDA-licensed HIV-1 Western blot, an FDA-licensed HIV-2 EIA, and a research use only HIV-2 Western blot. Based on these supplemental test results, 8 of the 10 specimens were negative and 2 specimens were indeterminate.

Specificity based on assumed zero prevalence of antibody to HIV-1 and/or HIV-2 in blood donors was estimated in these studies to be 99.94% (15,589/15,599) with a 95% confidence interval of 99.88% to 99.97%.

An internal study was performed to evaluate 342 serum and plasma repository specimens collected from individuals with medical conditions unrelated to HIV infection (Table V). Four of the 342 specimens (1.17%) were initially reactive and 3 of these specimens (0.88%) were repeatedly reactive. Of the 3 repeatedly reactive specimens, 2 were negative by supplemental testing and 1 was indeterminate.

An internal study was performed to evaluate 166 specimens collected from pregnant females. Specimens were collected during each trimester of pregnancy (Table V). Both the initial and repeat reactive rates for these specimens were 0.60% (1/166). The repeatedly reactive specimen was negative by supplemental testing.

An internal study was performed to evaluate 77 serum specimens containing potentially interfering substances (Table V). The initial and repeat reactive rates for these specimens were both 5.19% (4/77). Three specimens were positive and 1 specimen was negative by supplemental testing.
The overall sensitivity was estimated in these studies to be 100.00% (1,524/1,524) with a 95% confidence interval of 99.76% to 100.00%.

IR = Initially Reactive; RR = Repeatedly Reactive; CI = Confidence Interval

- Specimens from individuals with medical conditions unrelated to HIV infection included the following categories: anti-CMV positive (17), anti-EBV positive (18), anti-HSV positive (21), acute and recovered HAV infection (16), anti-HBs positive (20), anti-HTLV-I/HTLV-II positive (21), anti-HCV positive (27), rubella antibody positive (26), toxoplasma antibody positive (20), E. coli infections (1), yeast infection (13) syphilis serology positive (17), anti-nuclear antibody positive (17), influenza vaccine recipients (46), small pox vaccine recipients (10), elevated IgG and elevated IgM (12), and oncology (23).

- The 3 repeatedly reactive specimens included the following categories: anti-CMV positive, anti-HBs positive, and anti-HTLV-I/HTLV-II positive.

- Specimens contained the following potentially interfering substances: elevated triglycerides (28), elevated bilirubin (26), and elevated hemoglobin (23).

Assay Sensitivity

A total of 1,388 serum and plasma specimens from individuals known to be positive for HIV antibodies were tested with the ABBOTT PRISM HIV O Plus assay (Table VI). Of the 1,388 specimens tested, 1,388 specimens (100.00%) were repeatedly reactive.

Plasma specimens from individuals at increased risk for HIV infection tested with the ABBOTT PRISM HIV O Plus assay (Table VI). This study included a total of 605 specimens from the United States and 512 specimens from an HIV-2 endemic area (Republic of Côte d’Ivoire). Of the 1,117 specimens tested, 156 specimens (13.97%) were repeatedly reactive. Of the 156 repeatedly reactive specimens, 136 specimens (87.18%) tested positive by supplemental testing.

The overall sensitivity was estimated in these studies to be 100.00% (1,524/1,524) with a 95% confidence interval of 99.76% to 100.00%.

Increased Risk for HIV Infection

- Thirty-one specimens were diluted 1:10, 18 specimens were diluted 1:20, and 4 specimens were undiluted.
- The following risk factors were included: sex with an HIV infected partner, men who have sex with men, intravenous drug users, multiple sex partners, and patients with sexually transmitted diseases.
- The following risk factors were included: sex with an HIV infected partner, men who have sex with men, intravenous drug users, and multiple sex partners.

An internal study was performed to test specimens from individuals known to be positive for HIV-1 Group M antibodies. The Group M subtypes included in this study are shown in Table VII. A total of 276 plasma specimens were tested with the ABBOTT PRISM HIV O Plus assay. Of these 276 specimens tested, 276 specimens (100.00%) were reactive.

Sensitivity was also evaluated using 160 serial bleeds from 20 commercially available seroconversion panels. Each specimen was tested with the ABBOTT PRISM HIV O Plus assay, which detected the presence of HIV antibody at the same time or earlier than an FDA-licensed HIV-1/HIV-2 assay (Table VIII).
The ABBOTT PRISM HIV O Plus assay has an estimated sensitivity of 100.00% (95% binomial confidence interval of 93.84% - 100.00%) for postmortem serum specimens.
